## INVIVO CORPORATION ANNOUNCES INTRODUCTION OF NEW MRI MONITOR

10.31.08 Orlando, Florida – Invivo Corporation is announcing the release of their 6<sup>th</sup> generation MRI patient vital signs monitor called the Precess Patient Management Configuration and will debut it at this years RSNA. Invivo was the first company to develop a MRI patient monitor and is still the only US company to engineer MRI monitors from the ground up.

This revolutionary monitor is built off of Invivo's flagship Precess 3160 platform and utilizes the industries first Wireless ECG and Wireless SpO2 patient vital signs.

The Precess Patient Management configuration helps close the gap between MRI monitors and OR monitors. This new monitor from Invivo features the MRI industries first flexible mounting. Now anesthesia providers can have their MRI monitor mounted to their anesthesia machine just like they do in the OR. Mounting the entire MRI monitor to the anesthesia machine provides 1 common location for the clinician to access their equipment. This aids in quick actions and decisions during crisis situations which could result in a better patient outcome. Clinicians now have better access to the patient by having all lines from the MRI monitor and the anesthesia machine from a single location.

In addition to anesthesia mounts for all MRI anesthesia machines, this monitor also can be mounted to a wall or MRI table to help provide more usable room and better patient access in the MRI; a clear workflow advantage. This is extremely beneficial for smaller MRI rooms such as Mobile MRI environments.

One clear advantage of removing the traditional MRI monitor roll stand is that continuous monitoring during patient transportation is now effortless. Patients can now travel from induction or recovery room to the MRI on the same monitor. This provides an increased standard of care and improved throughput by using a single monitor to do what has traditionally taken two monitors.
